think4ever

SEPTEMBER 2025 – NOVEMBER 2026

What's new in think4ever

Tried think4ever before? Here is everything it has learned since, month by month, in plain words.

Each bar is one month. Its height is the number of new things you can do.

177 new things in **15** months

November 2026

12 NEW

Check it. Lock it. Share it.

Tools for checking and protecting the work: see how much of the plan is really in the code, freeze an agreed design, and share a clickable preview.

BUILD

Gap Analysis

How much of the plan is really in the code? Every concept item gets a percentage, what is built, what is missing, and the code as proof.

BUILD

From findings to tasks

Run the analysis for one phase or one task, turn what is missing into tasks, and compare before and now after a fix.

PLAN

Lock Design

Freeze the concept, UI screens and requirements. Nobody and nothing changes them until you unlock: not a teammate, not an AI.

DESIGN

Imported projects get their real screens

Bring in existing code and the platform rebuilds the app's own screens in their original look, tied to the concept.

SHARE

Interactive preview link

Share a full-screen, clickable preview of the screens only. Buttons and navigation work; nothing else is shown.

TEAM

Company Agent Skills

Write your company's standing instructions once. Every agent follows them in every project.

CONNECT

More from your coding tool

Edit the concept item by item, run the whole task board and start a Gap Analysis from Claude Code, Cursor or Codex.

SHARE

Export carries the whole design

A .thinkp file now includes styles, menus, images and documents, and can be imported as a new project from the start wizard.

ALSO NEW — Manage tokens, add to Cursor · Clearer phases · Documents carry your project's name · Explorer: collapse all, expand all

October 2026

13 NEW

Open to your tools

Your AI coding tool can build and run an app in the think4ever cloud, the app covers nearly everything the web does, and reports read like prepared business documents.

CONNECT

Build and run from your coding tool

Claude Code, Cursor or Codex can write files, install packages, start the app, read its logs and publish it in the think4ever cloud.

CONNECT

Public API 1.0

The API now covers almost the whole workspace: code import, version control, documents, discussions, share links and more.

AI

Analytical business reports

Eleven report types with charts, tables and conclusions in plain business language. Share by link or download as PDF.

APP

The app becomes a full client

Version 1.0.1 covers nearly everything the web workspace does, in eight languages, with a Windows installer.

TEAM

A proper welcome for new team members

A new member gets a welcome e-mail and chooses their own password at first sign-in. Details, roles and project access are set in one step.

ACCOUNT

Start from "What do you want to build?"

Choose your path on the first page. Your answer travels through sign-up, and the workspace opens on that step.

ACCOUNT

Sign in with an e-mailed code

No password needed: a six-digit code signs you in. Password rules are simpler too.

MARKETPLACE

A complete hiring workflow

Hire several freelancers on one job, revise offers as numbered versions, and follow a shared activity timeline in the chat.

ALSO NEW — Imported code is read completely · Step-by-step guides · Agent tasks use your model · Sidekick extras in the app · New logo; images stay put

September 2026

11 NEW

Your language. Ready for production.

The whole product in eight languages, a go-live review for existing code, and a marketplace that knows your project.

WORKSPACE

Eight languages

English, Spanish, Portuguese, French, German, Hindi, Dutch and Arabic with a right-to-left layout. One choice follows you everywhere.

AI

The AI answers in your language

Sidekick, the build chat and the design chat reply in the language you chose. E-mails and notifications follow it too.

BUILD

Production Hardening

A go-live review of your code: 39 checks in 9 areas, a score and an A–E grade, with evidence and a recommended fix per check.

BUILD

Fix the findings in one click

Hand the findings to think4ever agents, or copy a ready fix request for Claude Code, Cursor or Codex. Download the review as PDF.

BUILD

Imported code is understood better

The technology is detected from your code. React, Next.js, Remix, Supabase and Firebase projects are described correctly.

MARKETPLACE

Hiring that knows your project

"Ask Think" drafts the job post from your project, and every proposal gets an AI fit score with strengths and concerns.

MARKETPLACE

Exactly the access a freelancer needs

A contract grants a workspace login or a token for the freelancer's own coding tool, for chosen projects. It ends by itself.

AI

Claude Opus 5.5, and a quick model switch

A new top model. If a model keeps failing, a pop-up moves just that kind of work to another one in two clicks.

ALSO NEW Edit text in the design preview · Profiles, reviews and saved searches · Marketplace from the workspace

Last here three months ago? Everything above this line is new for you.

August 2026

16 NEW

A clear path from idea to running app

A start wizard, a "What's next?" board, share links for your own customers, real PDF and Word files, and builds that pause instead of failing.

WORKSPACE

Start wizard

A new project asks one question: analyse existing code, or design from an idea. Then it takes you there.

WORKSPACE

"What's next?" board

Five steps from concept to a running app, each marked done, in progress or ready. Click a step to start it.

SHARE

View & Share

Share a clean read-only view of the project by link, for people without an account. You choose the sections and an expiry.

SHARE

Real PDF and Word files

Export requirement documents and the Functional Architecture as .pdf and .docx, and the requirements text in five formats.

BUILD

Builds that pause instead of failing

Building an app from a design is much faster, and a step that fails pauses the plan so you can resume it.

BUILD

Code Quality scan

Scan the project for bugs, vulnerabilities and code smells, with severity and fix time. Send findings to the agents to fix.

BUILD

Application Architecture map

An interactive map of an existing codebase: its parts, the components inside them and how they relate.

DESIGN

Thumbnails, View Mode and a page chat

See a real picture of every screen, click through designs like a visitor, and ask questions about a page without changing it.

ALSO NEW Publish to Jira · Tasks made simple · Run App from Design mode · Safe uploads · Simpler menus, faster opening · Usable on a phone · Screens grouped by module · Sign in straight to work

July 2026

18 NEW

173 themes, and an AI that asks first

The visual side grew up, the AI became safer and steadier to work with, and large ideas could be built in phases.

DESIGN

173 ready-made themes

Pick the look of your screens from a catalog of complete themes, each with a screenshot and a live demo.

DESIGN

Your own theme, or the style of your website

Describe a look and the AI builds the theme. Or enter a website address and reuse its colours, fonts and logo.

AI

The AI asks before it changes anything

In both chats the AI shows what it plans to change and waits for "Confirm & Apply" or "Reject".

PLAN

Phases (Roadmap)

Split a concept into named phases, filter the canvas by phase and build one phase at a time.

BUILD

Build with us or with your own tool

Press Build and choose: think4ever agents, or Claude Code, Cursor, Codex and six other tools that read your design directly.

AI

Project Memory

Decisions, constraints and preferences are remembered per project and used in later sessions. You can view and edit them.

AI

Choose the model per type of work

Pick a model separately for concept, UI design, diagrams, chat, building and documents. GLM-5.2 and Kimi K3 joined the list.

MARKETPLACE

Freelance marketplace

Post jobs, send proposals, agree contracts and chat live. The freelancer gets access to the agreed project while the contract runs.

ALSO NEW

- Choose which pages to build
- One change across all screens
- Recovers by itself
- Functional Architecture page
- Environment Variables window
- Download the project, export the database
- Sidekick comfort
- A receipt of what the AI changed
- Eleven regions at sign-up
- Marketplace in the app

June 2026

18 NEW

Sidekick takes the wheel

The workspace changed shape, the assistant started doing the work instead of describing it, and the platform opened up to other tools.

AI

Sidekick does the clicking

The assistant answers live and acts: it changes the concept, creates tasks, opens the right page and runs menu actions for you.

AI

Build, run and import from the chat

Ask Sidekick to create or change UI screens, start or stop your app, show its logs, or import code from GitHub.

CONNECT

Your plan inside Claude Code, Cursor and Codex

AI coding tools connect over MCP and work from the same concept, designs and tasks. Setup guides for nine tools.

CONNECT

Public API

A documented API with access tokens you create, limit and revoke yourself, and a console to try calls.

PLAN

Eleven concept layers

Four new layers: API Endpoints, State & Lifecycle, Events & Jobs, Environment & Config. The plan now covers the whole product.

APP

think4ever app for Windows and Android

Projects, the concept canvas, requirements, UI previews, Sidekick and a developer workspace in a native app.

WORKSPACE

New layout, dark theme

Menus on top, Sidekick docked on the left on every page, and a dark theme with a light/dark switch.

CONNECT

Ten connectors

Jira, Confluence, Figma, GitHub, Slack, Notion, Linear, Sentry, Google Drive and OneDrive. Attach items to the chat or let the AI search them.

ALSO NEW

New projects start as a conversation · Discussions on any concept item · Changes History · The whole project in one file · Approve requirements before the build · Architecture view and object list · Builds survive interruptions · Chat history and question pop-ups · Developer Mode tools · Continue with Google

Last here six months ago? Everything above this line is new for you.

May 2026

17 NEW

From idea to running code in one place

The month the product became one connected tool: plan the project, switch to code, let the agents build it step by step, run it and share a public link.

BUILD

Developer Mode joins the workspace

One sign-in, two views of the same project. Switch from design to code: AI coding chat, file editor, terminal, database and a browser for your running app.

BUILD

Goals with a plan you approve

Describe what you want. The agents draft a step-by-step plan; you review it, untick steps, and run. Skip, pause or cancel at any time.

BUILD

Build from your design

"From Design" compares the code with your concept and UI designs and plans the work to close the gap.

BUILD

Run your app and share a public link

The app runs inside the workspace. One switch gives it a public address that anyone can open.

PLAN

Solution Designs Library

299 ready-made starting points in 10 industries. Search, preview and apply one with a click: screens, flows, data, roles and rules included.

CONNECT

VS Code extension

Edit project files in VS Code, keep a local folder in two-way sync, talk to the agents and send terminal errors back to them.

WORKSPACE

Start with "What do you want to build?"

Describe the idea in your own words, attach files, or import existing code from GitHub, a ZIP or your repository.

TEAM

Company Users with roles

Add team members, give them roles and decide per project who has access. Each member sees only what their role allows.

ALSO NEW

- Code to concept
- Sidekick answers without changing anything
- Concept changes propose tasks
- Create only the missing pages
- Diagrams from a prompt
- Limit what an agent may change
- Password reset by e-mail code
- India and Australia regions
- Any technology stack is welcome

April 2026

11 NEW

Run the project where you plan it

The workspace grew from "plan and build" into a place where a team can also run the project: issues, a knowledge base, feedback forms and a Jira connection.

TEAM

Issue tracker

Report and follow bugs, features and tasks inside the project: list, board and summary views, filters, comments and file attachments.

TEAM

Knowledge base

A wiki for each project with a block editor, auto-save, version history, templates, tags and Markdown export.

SHARE

Feedback forms by public link

Build a survey, poll or feedback form and share it by link. People answer without an account; results can be exported to CSV.

PLAN

Start a concept from your documents

Attach requirements, specs or notes. The AI writes the requirements from them or builds the whole concept.

AI

More AI models, plus Grok

Newer Claude, GPT, Gemini and DeepSeek models, and Grok as a new provider. Long answers are no longer cut short.

CONNECT

Jira connection

Connect a Jira project and bring its issues into the platform's issue tracker, with status and priority matched.

AI

Your own key works everywhere

Documents and presentations work with any provider's key, and several agents can work on one key at the same time.

TEAM

Comments and mentions in one place

All comment threads, your @mentions and every active share link are collected on one page.

ALSO NEW

- Extra instructions for a build
- Test data that fixes itself
- Richer security and test-case views

March 2026

15 NEW

Edit anything, undo anything

Requirements that keep the plan in step, a history you can step back through, design tools for every element, and the first account portal.

PLAN

Requirements that update the plan

Edit the requirements and the AI proposes the matching concept changes, each with a reason. Tick the ones you want and apply.

PLAN

Change History with one-click revert

Every AI change to the concept is listed with time and description. One click takes the concept back to before that change.

DESIGN

Edit any element in the design preview

Right-click an element to change its text size, colours and spacing directly, or choose "Ask AI to Change" for just that element.

DESIGN

20 page layouts with live preview

Choose the page structure before building: sidebar, dashboard, hero, grid, split screen and more, previewed on desktop, tablet and phone.

DESIGN

Your own images in the design

Upload a logo, pictures or media with an instruction such as "use this as the main logo" and the AI places them.

BUILD

Code editor and ZIP upload

Open any source file in a built-in editor, and bring an existing codebase in as a ZIP of up to 500 MB.

ACCOUNT

The account portal

Sign up once and enter your workspace with one click, already signed in. Your profile, settings and support live there too.

PLAN

Search across the whole concept

One search box finds screens, flows, data objects, roles, integrations and rules, and jumps to the result.

ALSO NEW

A written summary for every screen · One navigation across all pages · Live "AI is working" indicators · Containers · Commit history, diff and revert · Database export · User Guide and My Profile

February 2026

11 NEW

One workspace, six layers

The concept grew from screens only into a full picture of the product, and everything moved into one project workspace.

PLAN

A concept with six layers

Next to screens: Business Flows, Data Objects, Roles & Permissions, Integrations and Business Rules. Sidekick builds and edits all six.

WORKSPACE

The new Project Workspace

One menu for everything in a project: concept layers, UI designs, diagrams, documents, tasks, database, source code and version control.

PLAN

Bring your existing code

Point the platform at a codebase and it writes the concept from the code, with a live progress window.

PLAN

See the concept through one role

Pick a role and the screens it can reach are highlighted. Each screen lists who has access.

DESIGN

Designs and diagrams build in the background

UI designs and architecture diagrams are built while you keep working, and appear in their own pages when ready.

TEAM

Users, groups and permissions

Add team users, put them in ready-made groups and decide what each group may do. The interface hides what a user may not use.

AI

Use your own AI keys

Add your own provider keys under My API Keys and run all AI work on them.

BUILD

Better build planning and task control

Bigger builds are planned in stages, Cancel really stops a task, and the task list has filters, cancel-all and live status.

ALSO NEW Export and import a concept · Quick start on an empty concept · Project chat answers questions

January 2026

6 NEW

You choose the technology and the look

Two decisions the AI used to make alone became yours: what the product is built with, and how it looks.

BUILD

Technology Stack

Choose your backend, database and front end from long lists. Every agent and every document then follows your choice.

DESIGN

Theme gallery

Pick one of 34 ready-made colour themes for your UI design and preview it on sample elements first. (Today the catalog holds 173.)

AI

Test Case Agent

Test cases written from your code: numbered steps, the expected result of each step, priorities and tags, grouped by area.

BUILD

More dependable Git commits

Committing now works on a brand-new folder, picks the right branch and pulls the latest changes first.

ALSO NEW Concept toolbar in three menus · Developer Agent can start from nothing

December 2025

6 NEW

Your repository, your documents

Two things teams ask for early: a connection to their own code repository, and finished documents written from the concept.

BUILD

Version Control

Connect a project to GitHub, GitLab, plain Git or SVN. Commit, update and read the full log of every operation.

BUILD

The Developer Agent commits its own work

After a successful coding task the agent commits the changes to your repository, with its own explanation as the message.

SHARE

Documents written from your concept

Concept Summary, Functional Specification, Technical Specification and Database Design Document, each with a cover page and table of contents.

SHARE

Export as SVG and PNG

Download the concept as a clean vector drawing or a picture, and any flow diagram as an image.

ALSO NEW

Requirements questions accept free text

Straight into the new project

Last here a year ago? Everything above this line is new for you.

November 2025

4 NEW

The AI asks before it builds

The platform now helps you work out what you actually want before anything is drawn.

PLAN

Analyze Requirements

Describe a rough idea. The AI asks clarifying questions, with a "Let AI decide" option, and turns your answers into written requirements and a concept.

PLAN

Requirements stay with the concept

Every concept carries a written description of what the system should do. Read it, edit it and save it at any time.

PLAN

Card and Chart elements

Screens in a concept can now contain cards and charts, and the AI uses them when they fit.

AI

Voice Assistant lets you finish your sentence

A short pause no longer cuts you off: the assistant waits a moment longer before it answers.

October 2025

11 NEW

From concept to clickable screens

The month the platform learned to design. One button turns a concept into real pages you can click through and change by describing what you want.

DESIGN

Build UI Design

One button turns your concept into a full set of real pages with a shared style and working navigation between them.

DESIGN

Click through your design like an app

Open the designed pages in a browser tab, jump to any page from a Pages menu, and follow the links between screens.

DESIGN

Change a page by describing it

In the Modify Page chat you say what should change. The AI sees the page as you see it and changes only what you asked for.

DESIGN

Undo and version history for every page

Every change to a page is kept. Go back to any earlier version with one click; nothing is lost.

PLAN

Architecture diagrams from one concept

One button draws a full set of diagrams from your concept: user flow, data flow, database schema, sequence, deployment, security and more.

AI

Security Agent

A security review of your code: issues by severity with the affected files and references to CWE and OWASP. Download it as a Word report.

ALSO NEW

- Flow-diagram editor with its own Sidekick
- Agents build from your plan
- Try a screen as a clickable mock-up
- Export the concept as a picture
- Analytical Agent handles bigger data

September 2025

8 NEW

Talk your idea into a plan

Where this story starts: a workspace with projects, a visual concept canvas, an AI chat and a team of AI agents. In September the platform learned to listen, and to build from what it heard.

AI

Talk your idea into a concept

The Voice Assistant asks what you want to build, reads back a summary and draws the concept for you.

BUILD

One-click Build

A Build button hands your concept to the AI agents and takes you to the task list when the work is done.

AI

Analytical Agent

Ask a question about your data and get a report with tables, charts and conclusions, built only from your real data.

BUILD

A project that is ready from minute one

Every new project gets its own folder and its own database automatically. Nothing to set up by hand.

ALSO NEW

- Meet Sidekick
- Safer AI edits to a concept
- Project tabs keep their place
- QA Agent explains why an app would not start

The best way to see what changed is to open your workspace.

Your projects are where you left them. Sign in at think4ever.com and pick up from there.
